

## Professional system analysis

... with the new Steca TS Analyzer 1 software for the solar thermal controller Steca TR 0603mc

The Steca TR 0603mc is the first solar controller on the market capable of saving all operating data and balance sheet values of the solar energy system directly on a SD card. The analysis software Steca TS Analyzer 1 visualizes the system results. Temperatures, pump running times, heat quantity and flow: all measured values – even those collected over longer periods – are illustrated in diagrams to produce valuable comparative data. The documentation is completed with a control function: each state of the system as well as any faults or alerts are illustrated. Furthermore, the software has an export function for other spreadsheet programs.

This type of digital data collection and evaluation provides the user with up-to-date information about the performance of the solar energy system – all clearly displayed on the PC. The free monitoring software also stands out due to its user friendliness. It is individually configurable and easy to operate.

By offering the solar controller Steca TR 0603mc, paired with the free software Steca TS Analyzer 1, Steca is able to replicate the worldwide success of its solar controller series.
